

Avnet Design Services

Overview

Avnet Design Services is the technical arm of Avnet Electronics Marketing. Our mission is to accelerate our customers' successful time to market by advocating and implementing leading-edge semiconductor solutions for every stage of the design cycle. We offer highly trained and objective Field Applications Engineers (FAEs); FPGA and ASIC design centers; reference design kits and evaluation platforms and tools; and access to supplier technology, IP, training, and third-party technical alliances.

Design Services

FPGA design services are supported through a three-tiered support approach. Our local dedicated FAEs provide immediate, on-site support. Our regional Express FPGA Design Services team provides short term project design support from centralized locations. The Express team focuses on the optimization of existing designs, conversions from older or competitive architectures or file formats, and the integration and design of functional blocks that require two weeks or less of engineering effort. Our design center provides long term design support. Design Center consulting engagements are fully program-managed, contract-driven, and can take you all the way from concept-to-production or anywhere in between.

ASIC design services are provided from five ASIC centers employing over 30 engineers. Avnet Design Services has an 18-year ASIC history, with over 800 designs completed, and over 200 years combined experience. Our design centers provide RTL development, IP integration, test insertion, and layout services for deep submicron technologies.

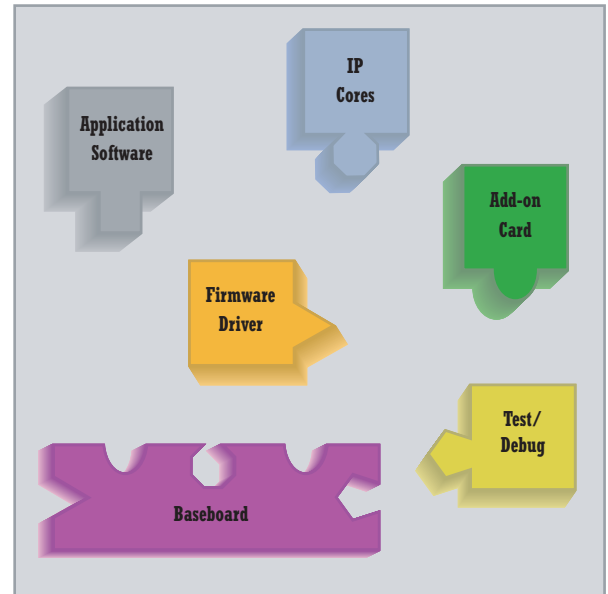

Field Resources

Our experienced Field Applications Engineers are extensions of our suppliers' engineering staff. They provide application, technology and product expertise. FAEs are certified by suppliers and continuously trained on new technologies, including new product roadmaps and applications updates. FAEs are cross-trained in all the technologies on the Avnet Cilicon line-card, making them semiconductor specialists. They create optimized semiconductor solutions by comparing and contrasting multiple technology approaches. In addition to in-depth supplier knowledge, our FAEs also provide access to a suite of services and solutions available exclusively through Avnet Design Services.

Avalon Reference Design System™

A successful reference design system requires a partnership of a variety of industry-leading semiconductor suppliers, IP core providers, firmware developers, applications program developers, design service providers, design tool providers and test and debug tool vendors. The Avalon Reference Design System partnership was formed with the goal of creating this new design environment. No single company could be an expert in all of the elements required to create a robust development environment.

The Avalon Reference Design System allows designers to create a customer reference design from a “plug and play” selection of compatible building blocks. Elements are created by Avnet Design Services and third party Avalon Reference Design System suppliers. The system consists of design elements, tool elements, and service elements that have been tested and verified within the environment and can be selected and assembled like an electronics design puzzle. This approach dramatically accelerates a designer's time to market by shaving weeks off the product development cycle.

Avalon modules can be used to build a complete system

Avnet Avenue™ Products

Designers need a short cut that allows parallel development activity, using off the shelf hardware, easily integrated IP cores, and a development environment with existing firmware and applications hooks targeted for particular applications. Avnet Avenue is where designers find hardware products to accelerate the evaluation, design, and debug stages of a design.

We offer three different types of products: evaluations kits, which are low cost evaluation tools to showcase new architectures; development kits, which are versatile platforms designed for IP creation and integration; and system solutions kits, which are tested and verified reference designs. Reference designs give the designer a complete working environment in which they can easily create additional features and capabilities.
