1 INSTALLATION

1.1 Introduction

Intellectual Property (IP) deliverables are collectively delivered as a single UNIX zipped tar file.

These installation instructions cover the following platform / operating system:

- UNIX

1.2 Disk space required

This installation will require approximately 700 Kbyte of free disk space.

1.3 Installation procedure

You will have a single, encrypted and compressed 'tar' file, of following format, for example:

BP062-BU-01000-r0p0-00dev2.tar.gz

The installation procedure is summarised below:

1.3.1 Unpacking the shipment

The following steps describe how to unpack the separate products delivered in this shipment.

1. Uncompress file

Execute the UNIX unzip command to obtain the tar file(s) <file>.tar:

```
gunzip <file>.tgz
```

where <file> is the name of the file supplied.

2. Extract tar files

To extract the design files, execute the UNIX gtar extract command:

```
gtar -xvf <file>.tar
```

NOTE: A version of GNU tar later than 1.13 should be used to untar the deliverables as some versions of tar have problems dealing with very long path names. To find the version of gtar being used type `gtar --version`.

This will generate the following top level directories:

- verilog
This directory will contain the Verilog OVL version of the AMBA 3 AXI protocol checker and the AMBA 3 AXI standard definitions file.
- sva
This directory will contain the SystemVerilog version of the AMBA 3 AXI protocol checker.
- docs
This directory will contain a User Guide and this Release Note.

1.3.2 Installation of the OVL Library

The OVL assertion library can be downloaded from www.eda.org

To use the Verilog OVL version of the AMBA™ 3 AXI™ Protocol Checker, you must install the OVL assertion library *.vlib and *.h components and you must configure your simulator as described in chapter 2 of the User Guide.
