M. Wu: ENEE631 Digital Image Processing (Fall'01)

Last Time

- Pixel-based operation ~ *input-output luminance mapping*
 - Gamma correction
 - Histogram based operation
- Spatial FIR filtering using small "mask" ~ *simple to compute*
 - Spatial averaging
 - Median filtering
- Today
 - Continued on image enhancement
 - Image sharpening
 - LPF/HPF/BPF
 - Image interpolation
 - Edges and textures

M. Wu: ENEE631 Digital Image Processing (Fall'01)

Lec17 – Enhancement/Manipulation 11/1/01 [2]

Image Sharpening

- Use LPF to generate HPF
 - Subtract a low pass filtered result from the original signal
 - HPF extracts edges and transitions

- Enhance edges

$$\begin{aligned}
 I_0 &\rightarrow I_{LP} \\
 \rightarrow I_{HP} &= I_0 - I_{LP} \\
 \rightarrow I_1 &= I_0 + a * I_{HP}
 \end{aligned}$$

M. Wu: ENEE631 Digital Image Processing (Fall'01)

Lec17 – Enhancement/Manipulation 11/1/01 [5]

Example of Image Sharpening

Original circuit image is from Matlab Image Toolbox.

- $v(m,n) = u(m,n) + a * g(m,n)$
- Often use Laplacian operator to obtain $g(m,n)$

	-1	0	1
-1	0	-1/4	0
0	-1/4	1	-1/4
1	0	-1/4	0

M. Wu: ENEE631 Digital Image Processing (Fall'01)

Lec17 – Enhancement/Manipulation 11/1/01 [6]

Spatial LPF, HPF, & BPF

- HPF and BPF can be constructed from LPF
- Low-pass filter
 - Useful in noise smoothing and downsampling/upsampling
- High-pass filter
 - $h_{HP}(m,n) = \delta(m,n) - h_{LP}(m,n)$
 - Useful in edge extraction and image sharpening
- Band-pass filter
 - $h_{BP}(m,n) = h_{L2}(m,n) - h_{L1}(m,n)$
 - Useful in edge enhancement
 - Also good for high-pass tasks in the presence of noise
 - ♦ avoid amplifying high-frequency noise
 - See also Jain's Fig. 7.25

M. Wu: ENEE631 Digital Image Processing (Fall'01)

Lec17 – Enhancement/Manipulation 11/1/01 [8]

Interpolation / Zooming

- How to make up the new pixels?
- Replication according to the nearest neighbor
 - Pros: simple
 - Cons: zig-zag boundary ~ aliasing
- Bilinear interpolation

- Extend 1-D linear interpolation
- Do two horizontal and one vertical 1-D interpolation

$$F(p', q') = (1-a) [(1-b) F(p, q) + b F(p, q+1)] + a [(1-b) F(p+1, q) + b F(p+1, q+1)]$$

$$F(p', q') = 0.5 * [0.5 * F(p, q) + 0.5 * F(p, q+1)] + 0.5 * [0.5 * F(p+1, q) + 0.5 * F(p+1, q+1)]$$

M. Wu: ENEE631 Digital Image Processing (Fall'01)

Lec17 – Enhancement/Manipulation 11/1/01 [9]

Examples of Image Interpolation

4x zoom (nearest neighbor)

4x zoom (bilinear)

Frequency-Domain Interpretation

- Multi-rate sig. proc. (ENEE624)
- Upsampling
 - Upsampling with zero interlacing ~ replicated spectrum
 - LPF to filter out the spectra replicas in high-frequency part
 - Ideal filter vs. practical filters
 - ♦ nearest neighbor approach for 2x zoom use
 - ♦ [think] what equiv. filters used for bilinear interpolation?
- Downsampling
 - Aliasing as spectra replicas becomes closer
 - LPF to avoid aliasing
- Sampling rate conversion with rational rate M/N
 - Upsample with zero interlacing by M → LPF → Downsample

1	1
1	1

Frequency-Domain Interpretation (cont'd)

From Crochiere-Rabiner "Multirate DSP" book Fig.2.15-16

More on Interpolation

- Other filters
 - Bi-cubic interpolation (3rd order polynomial)
- Interpolation that avoids blurred edges and textures
 - Edge-preserving interpolation
 - ♦ recent research papers in ICIP

Edges

- Edge: pixel locations of abrupt luminance change
- For binary image
 - E.g., take black pixels with immediate white neighbors as edge pixel
 - Detectable by XOR operations
- For continuous-tone image
 - Edge map ~ edge intensity + edge directions
 - ♦ spatial luminance gradient of edge pixel is perpendicular to the edge

Edge Detection

- **Measure gradient vector**
 - Along two orthogonal directions ~ usually horizontal and vertical
 - ♦ $g_x = \partial L / \partial x$
 - ♦ $g_y = \partial L / \partial y$
 - Magnitude of gradient vector
 - ♦ $g(m,n)^2 = g_x(m,n)^2 + g_y(m,n)^2$
 - ♦ $g(m,n) = |g_x(m,n)| + |g_y(m,n)|$ (preferred in hardware implement.)
 - Direction of gradient vector
 - ♦ $\tan^{-1} [g_y(m,n) / g_x(m,n)]$
- **Characterizing edges in an image**
 - (binary) Edge map: specify “edge point” locations with $g(m,n) > \text{thresh.}$
 - Edge intensity map: specify gradient magnitude at each pixel
 - Edge direction map: specify directions

Common Gradient Operators for Edge Detection

- Move the operators across the image and take the inner products
- Gradient operator is HPF in nature
 - ♦ *could amplify noise*
 - ♦ *Prewitt and Sobel operators compute horizontal and vertical differences of local sum to reduce the effect of noise*

Examples of Edge Detectors

Examples of Edge Detectors

Other Edge Detection Methods

- **Compass operators**
 - Directly measure gradients in a selected number of directions
 - ♦ e.g., horizontal, vertical, diagonal
- **Laplacian operators**
 - [1-D case] $-d^2f / dx^2$
 - ♦ give two extremes and one zero crossing around edges
 - [2-D case] $\nabla^2 f = (\partial^2 f / \partial x^2) + (\partial^2 f / \partial y^2)$
- **Improved detection in presence of noise**
 - Moderate LPF before applying edge detector
- **Performance comparison of edge detector** ~ Jain's Sec.9.4

0	-1/4	0
-1/4	1	-1/4
0	-1/4	0

Texture

- **Observed in structural patterns of objects' surfaces**
 - [Natural] wood, grain, sand, grass, tree leaves, cloth
 - [Man-made] tiles, printing patterns
- **"Texture" ~ repetition of "texels" (basic texture element)**
 - Texels' placement could be periodic, quasi-periodic, or random

From <http://texlib.povray.org/textures.html>

Characterize textures

- **Structural measures**
 - Periodic textures
 - ♦ Features of deterministic texel: gray levels, shape, orientation, etc.
 - ♦ Placement rules: period, repetition grid pattern, etc.
 - Textures with random nature
 - ♦ Features of texel: edge density, histogram features, etc.
- **Statistical measures** ~ mainly for textures with random nature
 - Model as a *random field* ~ 2-D sequence of random variables
 - Autocorrelation function: measuring the relations among those r.v.
 - ♦ $R(m,n; m',n') = E[U(m,n) U(m',n')]$
 - ♦ "wide-sense stationary": $R(m,n; m',n') = R_L(m-m', n-n') \& \text{const. mean}$
 - Fit into random field models ~ *analysis and synthesis*
 - ♦ focus on 2nd-order statistics ~ usually two textures with same 2nd-order prob. distribution appears very similar

Summary

- **Continued on image enhancement**
 - Image sharpening
 - LPF/HPF/BPF
 - Image interpolation
- **Edges**
- **Textures**
- **Next time**
 - Image manipulations
- **Reading Assignment**
 - Jain's book 7.4, 9.4, 9.11 (2.9-2.11)
